

ENGINEERING REBOOT 2026

Day 26 Field Manual

Locked Publication Edition v1.0

Phase II — Professional Engineering Practice

Day Theme: *A modern software engineer is only as effective as the development environment they understand and can confidently use.*

Document Control

Field	Value
Document Type	Daily Field Manual
Classification	Daily Execution Guide
Version	1.0
Status	Approved and Locked
Authority	Week 6 Master Workbook
Template	Phase II Daily Field Manual Template v1.0

Mission

Establish a professional Linux development environment and become comfortable operating within the platform used by modern software engineering teams.

Engineering Context

Linux is the common platform for cloud systems, containers, CI/CD pipelines, and many production environments. Today's work establishes the practical foundation for the remainder of the reboot.

Learning Objectives

Technical: Verify WSL2, navigate Linux, execute Bash commands, verify Python and Git.

Engineering: Apply incremental implementation, disciplined validation, documentation, and engineering review.

Core Concepts

WSL2, Linux distributions, terminal fundamentals, filesystem hierarchy, absolute and relative paths, home directory, and basic Bash navigation.

Exercises

1. Verify the development environment.
2. Practice Linux navigation.
3. Create and manipulate files and directories.

Mini Project

Linux Workspace Builder: Create a reusable Bash script that prepares a standard development workspace and verifies Python and Git availability.

Validation Matrix

- WSL2 operational
- Linux accessible
- Python verified
- Git verified
- Navigation complete
- Mini-project successful

Evidence Checklist

Capture WSL2 terminal, Python version, Git version, directory creation, mini-project execution, and Git operations.

Engineering Review

Review readability, organization, maintainability, reuse, and opportunities to simplify the implementation.

Notes.md Guidance

Record Linux commands, Windows/Linux observations, terminology, and implementation notes.

Journal.md Guidance

Reflect on what you learned, engineering observations, differences from Windows, and areas requiring further practice.

Completion Checklist

Exercises complete; mini-project complete; validation complete; engineering review complete; Notes.md and Journal.md updated; Git committed, pushed, fetched, verified; evidence archived.

Preview

Day 27 focuses on Bash fluency, file permissions, environment variables, and command composition.
