Edition	Locked Publication v1.0

Workbook Purpose

Defines the objectives, scope, engineering expectations, deliverables, and execution strategy for Week 6. This workbook serves as the planning authority for the week.

Week 6 Theme

A professional engineer is defined not only by the software they build, but by the discipline, workflow, and judgment they apply while building it.

Mission Statement

Week 6 transitions the reboot from rebuilding Python proficiency to practicing professional software engineering through a modern development environment and disciplined workflow.

Strategic Objectives

Technical: Linux, WSL2, Bash, Python under Linux, Git workflows, virtual environments, package management.

Engineering: modular design, reusable abstractions, defensive programming, disciplined testing, maintainability, and engineering reviews.

Engineering Perspective

Professional tooling and repeatable workflows allow engineers to focus on solving problems rather than managing their tools.

Daily Workflow

Review mission → Study → Exercises → Design → Implement → Validate → Engineering Review → Evidence → Notes → Journal → Git verification.

Success Criteria

Environment competency, engineering competency, complete documentation, synchronized repository, and captured evidence.

Transition to Week 7

Completion of Week 6 prepares the reboot for Object-Oriented Programming and larger multi-module systems.
