

SOFTWARE ENGINEERING REBOOT 2026 – WEEK 1

Development Environment & Foundations | June 1–5, 2026 | 7:00–8:00 PM

Weekly Objective: Build a complete software engineering workstation and publish your first Python project to GitHub.

MONDAY Install Python, Git, VS Code; create workspace folders; install extensions.
Deliverable: Development environment operational.

TUESDAY Configure GitHub; create repository; learn Git basics; make first commits.
Deliverable: GitHub repository online.

WEDNESDAY Install WSL2; learn Linux terminal basics; practice navigation.
Deliverable: Linux environment operational.

THURSDAY Learn Python variables, input/output, and data types; build Age Calculator and Temperature Converter.
Deliverable: Two working Python programs.

FRIDAY Build Calculator Project; test; commit; push to GitHub.
Deliverable: First complete project published.

WEEKLY TARGETS

■ Python Installed ■ Git Installed ■ VS Code Installed ■ WSL2 Installed
■ GitHub Active ■ Repository Created ■ 5+ Commits
■ Age Calculator Completed ■ Temperature Converter Completed ■ Calculator Completed

KEY COMMANDS

Git: git init | git add . | git commit | git push | git pull | git status

Linux: pwd | ls | cd | mkdir | cp | mv | rm

Python: python script.py

ACCOUNTABILITY CHECKLIST

■ Attended all 5 sessions ■ Repository on GitHub ■ Calculator works
■ 5+ commits completed ■ Can explain Git workflow ■ Can run Python scripts
■ WSL2 functioning

Week 1 Success: A functioning developer workstation, a GitHub repository, and your first published Python project.
